

## No. 2: Diesel Fuel Spill In Creek

May 05, 2008

Sevier County, Tenn. — A spill of diesel fuel into Valentine Branch was discovered early this morning by a local grading contractor. The contractor had parked equipment on an incline causing diesel fuel to leak onto the ground. The fuel flowed into the adjacent branch where it flowed downstream for approximately 1/4 mile. The amount of fuel released was unknown, but estimated to be 8-10 gallons.

The Sevier County Emergency Management Office was alerted by the contractor. The local fire department placed strategically located containment booms to slow the spread of the contaminant. Management officials ordered SHEEN-MAGIC© Environmentally Safe Cleaner for the cleanup effort. Time was critical as the flow must not be allowed to reach a larger stream. 5 gallons of SHEEN-MAGIC© was rushed to the spill site.

**TREATMENT:** Emergency Management personnel applied SHEEN-MAGIC© Environmentally Safe Cleaner to the site. The application process was to deliver the product, undiluted, directly to the spill surface via low pressure garden type sprayer. Approximately 5 gallons of SHEEN-MAGIC© were used in the 2 hour cleanup effort. Examination with monitoring equipment confirmed the diesel contamination of the stream was removed with the initial treatment.

**RESULT:** After treatment with SHEEN-MAGIC© aquatic life has returned to stream site. No other action was required by Emergency Management personnel. **Site declared to be clean and safe.**
